

Model D-28-6

Make-Up Air and Combustion Air Diffuser Supplies Combustion Air for Fuel-Burning Appliances

Features & Benefits

- Works in any home as a fresh air supply
- Reduces drafts caused by negative pressure
- Aids in reducing indoor air pollution by replacing exhausted air
- Traps cold air entering the home
- Provides combustion air when other methods do not supply sufficient air

Here's How It Works...

The Skuttle Make-Up Air Diffuser supplies supplementary combustion air to appliances (furnaces, dryers, etc.) with inadequate combustion air sources. Generally installed 12 inches from the appliance's combustion air intake, the Diffuser connects to a 6-inch insulated duct, which in turn, connects to a screened, fresh air inlet mounted on the home's exterior. As the colder, heavier outside air enters the Diffuser, the unit acts as a check valve or cold air trap, automatically diffusing auxiliary combustion air into the area around the appliance.

Installation Package includes intake hood and mounting screws.

Specifications

- Fresh Air Inlet 6" diameter

**Quality Made
in the USA**
